### TeleDial GSM-4G Digital Dial Panel

The TeleDial GSM-4G Door Intercom offers a wireless door entry solution using mobile phone 4G technology. The unit translates a dialed flat or office number and makes a call to any mobile or landline, allowing a conversation to take place and the door or gate to be released. The unit is programmable for up to 200 users, with either one or two numbers per user.

The TeleDial GSM-4G offers an economical solution for door entry, particularly where wiring is difficult or undesirable. The compact backlit keypad offers an excellent alternative to conventional individual call button panels, especially for larger blocks of flats or offices. It is also ideally suited for locations where off-site communication is required or where system expansion is likely.

<b>TDDPN4G-S</b>	TeleDial GSM Digital Dial Panel with integrated PinNet Reader (illustrated) <i>Finish: Brushed Stainless Steel</i>
<b>TDDPN4G-M</b>	TeleDial GSM Digital Dial Panel with integrated PinNet Reader <i>Finish: Mirror Polished Stainless Steel</i>

### Dimensions (mm)

	Height	Width	Depth
Plate	483	127	-
Back Box	445	89	38

**Coded access and Caller ID access are built-in.** The units can also feature dedicated buttons for a trade time-switch or for calling directly to a porter or office. Settings and user numbers are easily changed using our web-based portal.

### 1,1 to release the door

When a call is received, the resident simply dials 1,1 on their telephone keypad to admit visitors (or 2,1 for a second door or vehicle gate).

The TeleDial GSM-4G is available with or without a PinNet proximity reader and in two standard finishes: either brushed or mirror-polished 316 stainless steel. It can also be made to custom dimensions by special order.
